# Understanding repurchase intention in online ticketing: a hybrid PLS-SEM and ANP approach

Surya Alam<sup>1\*</sup>, Fajar Supanto<sup>1</sup> and Syaiful Arifin<sup>1</sup>

## Abstract

This study explores the factors impacting repurchase intention in Indonesia's online ticketing platforms, focusing on perceived ease of use, perceived usefulness, perceived price, customer satisfaction, and trust. While these variables have been widely studied in developed markets, limited attention has been paid to emerging economies with strong price sensitivity and rapid digital adoption. A quantitative survey was conducted among Indonesian consumers with prior experience in online ticketing. The data were analyzed using PLS-SEM to test the structural connections. Additionally, Analytic Network Process (ANP) was employed to prioritize strategic interventions. Findings reveal that perceived ease of use, perceived price, customer satisfaction, and trust significantly impact repurchase intention. In contrast, perceived usefulness shows no significant influence on satisfaction or repurchase intention—suggesting that Indonesian users emphasize practical usability and price fairness over long-term utility. The ANP highlights secure transactions and transparent pricing as key priorities. This research contributes to the literature on digital consumer behavior in emerging markets by demonstrating contextual deviations from established models. For practitioners, it underscores the need to enhance user-friendly design, pricing transparency, and trust-building mechanisms. Future studies should expand to other e-commerce sectors and integrate qualitative methods for deeper insights.

**Keywords** Repurchase intention, Perceived ease of use, Perceived usefulness, Perceived price, Customer satisfaction, Trust

## Introduction

The rapid transformation of the digital landscape has driven notable growth in the e-commerce industry across various sectors, including online ticket booking services [1]. The advancement of information technology has driven changes in consumer behavior, where ease of access and convenience have become key factors in purchasing decisions [2, 3]. One of the crucial elements impacting repurchase intention (RI) in online ticketing services in Indonesia is consumers' perception of ease of use [4], perceived usefulness (PU) [5, 6], and the perceived price (PP) [7]. However, these variables do not

directly influence RI without intermediaries such as user satisfaction and brand trust.

While repurchase intention has been extensively studied in developed markets, the understanding of how these factors operate in emerging economies like Indonesia remains limited. This highlights a gap in the literature, particularly regarding the role of price sensitivity and digital trust, which may behave differently compared to more mature digital markets [8–11]. This study addresses this gap by providing empirical evidence from an emerging market context, thereby extending the theoretical understanding of digital consumer behavior beyond developed countries.

Research on the factors affecting RI in online ticketing services holds great significance in both academic and practical contexts. Academically, this study can enrich

<sup>1</sup> Universitas Merdeka Malang, Malang, Indonesia

insights in digital marketing and e-commerce, particularly regarding the mediating role of customer satisfaction (CS) and trust in shaping RI [12, 13]. Practically, the findings of this research can be utilized by online ticketing service providers to enhance customer loyalty and improve their competitive advantage in an increasingly saturated industry [14].

The phenomenon occurring in Indonesia shows that although the use of online ticketing services continues to increase, not all customers exhibit high loyalty to a specific platform [15–17]. Many customers tend to switch platforms based on price and promotional offers. This indicates that while PEU, PU, and PP are important factors, other aspects such as CS and trust also contribute to the formation of repurchase decisions.

The research gap in this study lies in the lack of understanding of how factors such as PEU, PU, and PP indirectly influence RI through CS and trust. Previous studies have predominantly focused on the direct relationship between these factors and RI, without considering the mediating role of CS and trust [18–21]. In the context of competition within Indonesia's online ticketing industry, an in-depth understanding of customer preferences and behavior is essential for designing optimal marketing strategies. Service providers must continuously improve the quality of their services to meet customer expectations and create a satisfying and trustworthy experience. Therefore, this research is expected to offer valuable insights for industry actors in their efforts to enhance customer loyalty through improved satisfaction and trust.

Therefore, this study contributes not only to the development of academic literature in digital marketing and e-commerce but also provides practical implications for business practitioners. The findings can serve as a basis for formulating more effective marketing strategies, whether in terms of enhancing user experience, offering more competitive pricing, or strengthening security systems to build greater customer trust. Thus, understanding the relationship between PEU, PU, PP, CS, and trust in shaping RI can be a key factor for the success of online ticketing businesses in Indonesia. Through this study, it is hoped that companies can better understand consumer behavior and implement more appropriate strategies to maintain customer loyalty.

The primary objective of this study is to analyze how PEU, PU, and PP influence RI in online ticketing services in Indonesia, considering CS and trust as mediating variables. By understanding the links among these factors, online ticketing service providers can develop more effective strategies to enhance customer loyalty. To address these research objectives, several research

questions will be explored in this study: (1) How does PEU influence RI in online ticketing services in Indonesia? (2) How does PU influence RI? (3) How does PP influence RI? (4) To what extent does CS mediate the relationship between PEU, PU, and PP with RI? (5) To what extent does trust mediate the relationship between PEU, PU, and PP with RI?

## Literature review

### The link among perceived ease of use, customer satisfaction, trust, and repurchase intention

According to Venkatesh et al. [22], PEOU describes an individual's belief that using a particular system or technology requires minimal effort. This concept originates from the Technology Acceptance Model (TAM) developed by Davis et al. [23], proposing that perceived simplicity in usage positively influences users' willingness to embrace the technology. In the context of online ticketing services, PEOU reflects the ease of accessing the platform, searching for tickets, making payments, and receiving booking confirmations without significant technical difficulties [24].

PEU directly contributes to CS because customers tend to feel satisfied when they can use a service effortlessly and without frustration [25–28]. However, some studies show mixed evidence: while some users report high satisfaction with easy-to-use platforms, others indicate that even with high usability, external factors such as service reliability or booking fees may override PEU's influence. In online ticketing, an intuitive interface and fast transaction process increase satisfaction, whereas navigation difficulties or complex payment steps reduce it. This creates an unresolved debate regarding whether PEU alone is sufficient to drive CS or if additional factors must be considered.

Similarly, PEU affects Trust [29, 30]. Individuals who find a system user-friendly often perceive it as reliable and professional. Yet, some evidence suggests that even highly usable platforms may not automatically foster trust if security concerns or unclear policies exist, highlighting context-specific boundary conditions.

PEU is also linked to Repurchase Intention (RI) [26–28, 31]. Ease of use tends to create a positive experience that encourages repeat purchases. Nevertheless, contradictory findings exist where high PEU does not translate into RI when competing platforms offer better incentives or loyalty programs.

H1a: PEU positively influences CS.

H1b: PEU positively influences Trust.

H1c: PEU positively influences RI.

### The link among perceived usefulness, customer satisfaction, trust, and repurchase intention

Davis et al. [23] describe the perception that engaging with a particular system will yield functional benefits or enhance one's performance. In the context of online ticketing services, PU reflects how much customers perceive the service as helpful in making ticket purchases faster, more efficient, and more convenient compared to traditional methods.

PU positively influences CS [32, 33]. Yet, studies in emerging markets show mixed results: while usefulness is generally valued, it may act as a hygiene factor, its presence does not boost satisfaction, but its absence reduces it. Therefore, the debate is whether PU alone drives CS or if other motivators, such as PEU or PP, are stronger determinants.

PU also contributes to Trust [34, 35]. Platforms that reliably help users save time build trust. However, inconsistent findings exist: even useful platforms may fail to build trust if users experience intermittent errors or lack confidence in payment security.

PU can influence RI [36, 37] but empirical studies reveal boundary conditions: commoditization and competitive parity can reduce PU's salience in motivating repeat purchases. Hence, the literature highlights a gap: how PU interacts with satisfaction and trust under context-specific conditions like Indonesian online ticketing remains unclear.

H2a: PU positively influences CS.

H2b: PU positively influences Trust.

H2c: PU positively influences RI.

### The link among perceived price, customer satisfaction, trust, and repurchase intention

PP refers to the customer's perception of cost relative to value [38]. PP influences CS, Trust, and RI, but evidence is mixed. High perceived value increases satisfaction and loyalty [39, 40], yet some studies find that customers tolerate higher prices if convenience or loyalty incentives exist. *This illustrates an unresolved debate: how price perception interacts with satisfaction and trust under different competitive scenarios.*

PP affects Trust [41, 42]. Transparent pricing fosters trust, but hidden fees or inconsistent discounting can erode it. PP also directly influences RI [43–45]. Boundary conditions such as discount intensity, competitor pricing, or urgency of ticket purchase may moderate this relationship.

H3a: PP positively influences CS.

H3b: PP positively influences Trust.

H3c: PP positively influences RI.

### The link among customer satisfaction, trust, and repurchase intention

Kotler & Keller [46] explain that CS is the degree to which a customer's expectations are met or exceeded by the product or service, leading to a positive perception of the overall experience. Trust is the belief that the service provider is reliable, dependable, and will act in the customer's best interest [47]. RI is the likelihood that a customer will return to the same service or product provider for future purchases based on their past experiences [48]. CS has a significant influence on RI [19, 20, 49]. When customers are satisfied with a service, they are more likely to return for future purchases. A positive experience, such as easy ticket booking and reliable service, encourages repeat business as satisfied customers trust the brand and feel more confident in its ability to meet their needs again. Dissatisfaction, on the other hand, may cause customers to seek alternatives, decreasing their likelihood of repurchasing. Trust strongly influences RI [26–28, 50, 51], but conflicting evidence exists regarding its relative importance compared to satisfaction in predicting RI.

H4a: CS positively influences RI.

H4b: Trust positively influences RI.

### Customer satisfaction and trust as mediators

CS and Trust mediate the effects of PEU, PU, and PP on RI [18, 43]. This addresses a key literature gap: while prior studies examined direct effects of TAM constructs on RI, the mediating role of satisfaction and trust, especially under Indonesia's online ticketing context, remains underexplored. Trust can also serve as a mediator between PEU, PU, PP, and RI [34, 52]. When a customer perceives the service as easy to use, valuable, and fairly priced, these perceptions can contribute to building trust in the service provider. Trust, in turn, enhances the customer's intention to repurchase. If customers trust that the platform will reliably deliver its promises, they are more likely to return for future transactions, even if there are other alternatives available. Trust can mediate the effect of PEU, PU, and PP on RI because it reduces perceived risks and uncertainty, thus encouraging customers to feel secure in their decision to repurchase. Without trust, even positive perceptions may not lead to repurchase if customers are unsure about the reliability or security of the platform. In both cases, CS and trust help explain why certain perceptions (ease, usefulness, and price) lead to RIs by influencing how customers feel about their experience and their confidence in the service.

H5a: CS mediates the link among PEU and RI.

H5b: CS mediates the link among PU and RI.

H5c: CS mediates the link among PP and RI.

H6a: Trust mediates the link among PEU and RI.

H6b: Trust mediates the link among PU and RI.

H6c: Trust mediates the link among PP and RI.

Additionally, Fig. 1 illustrates the research framework, highlighting the links among PEOU, PU, PP, CS, Trust, and RI within an online ticketing context. This framework guides the investigation into how these factors influence consumer behavior and repurchase decisions.

## Methodology

### Research design

This study employs a quantitative approach with a survey research design. The primary objective of this research is to analyze the influence of PEU, PU, PP, CS, and Trust on RI within the context of online ticket service users in Indonesia. The survey approach was chosen because it allows the researcher to collect representative data from the population of online ticket service users. This approach facilitates testing the links among relevant variables statistically. Additionally, this design enables the researcher to explore how factors such as PEU, perceived benefits, PP fairness, as well as CS and trust, influence the intention to repurchase tickets. It should be noted that using a survey-based design may introduce certain

biases, particularly since respondents are self-selected and limited to those with prior online ticketing experience. This potential bias is addressed in the sampling and analysis procedures.

### Population and sample

The population in this study consists of the Indonesian population who have used online ticket services within the past six months (July–December 2024). The focus is on users who have experience purchasing tickets through online platforms, including air travel, train tickets, and entertainment event tickets. Data collection was conducted between January 5 and January 20, 2025.

To ensure respondents met the criteria, a screening item was included asking “When was your most recent online ticket purchase?” Respondents were instructed to report the exact date of their last transaction. Only those who made a purchase within the last 60 days were included in the sample to reduce recall bias. Additionally, respondents were encouraged to refer to their booking confirmations or e-tickets as memory anchors when answering the questionnaire, ensuring more accurate and reliable responses.

The sample comprises 400 respondents selected using a purposive sampling method, where participants were

**Fig. 1** Study framework

recruited through online channels including social media, travel forums, and platform-specific user communities. The distribution of respondents across platforms was as follows: Traveloka (40%), Tiket.com (35%), and other platforms including Locket, KAI Access, and Go-Tix (25%). Respondents represented diverse regions in Indonesia, including Java, Sumatra, Kalimantan, Sulawesi, and Bali, and varied demographics such as age, gender, education level, and frequency of online ticket purchases. Purposive sampling was chosen over random sampling because the research objective focuses specifically on experienced online ticket users; including respondents without relevant experience would dilute the accuracy of insights into repurchase behavior and online service perceptions. This method ensures that respondents have sufficient knowledge to answer the questionnaire meaningfully, enhancing the validity of the study findings.

Out of the 400 respondents involved in the study, 327 valid samples met the criteria and were analyzed further. The samples that did not meet the criteria or provided incomplete responses were excluded from the analysis. To address potential non-response bias, the characteristics of early respondents (first 50% of responses) were compared with late respondents (last 50% of responses), and no significant differences in age, gender, or usage frequency were found, suggesting minimal bias due to non-response.

Furthermore, a post-hoc power analysis using G\*Power confirmed that with 327 valid respondents, the study has sufficient statistical power ( $> 0.80$ ) to detect medium effect sizes in the structural model with the number of predictors considered, ensuring the robustness of the PLS-SEM analysis. This valid sample size is considered sufficiently large to ensure a good representation of the online ticket service user population.

### Measurement instruments

The measurement instrument used in this study is a questionnaire consisting of a series of questions designed to measure each of the variables under investigation. Each variable, such as PEU, PU, PP, CS, Trust, and RI, is measured using several specific items. The constructs of PEU, PU, PP, CS, Trust, and RI are primarily derived from established consumer behavior and technology acceptance theories. PEU and PU come from Davis' Technology Acceptance Model [23], which suggests that the ease of use and perceived utility of a system influence its adoption. PP is rooted in consumer price sensitivity research, such as Zeithaml et al. [38], which examines how pricing affects purchasing decisions. CS is drawn from Oliver & Swan's [53] work on consumer fulfillment, while Trust is based on definition and its application in online contexts by Pavlou [54]. Lastly, RI is influenced by research on

consumer loyalty and repeat purchasing behavior, such as Chaudhuri & Holbrook [55]. A 5-point Likert scale is used to assess the level of agreement or disagreement of respondents with each statement provided. The scale ranges from strongly disagree to strongly agree, allowing the researcher to measure the intensity of respondents' attitudes or perceptions. This in-depth measurement helps the researcher collect comprehensive and detailed data about users' perceptions of online ticket services and their attitudes toward repurchasing.

Furthermore, the questionnaire has been tested for validity and reliability to ensure that the instrument used accurately and consistently measures the intended variables. The results of the validity and reliability tests indicate that the questionnaire effectively measures the intended variables with both accuracy and consistency. The construct validity was confirmed with a factor loading value exceeding the 0.7 threshold, ensuring that each item accurately reflects the underlying concept. Reliability tests revealed a Cronbach's Alpha value of 0.87, indicating high internal consistency and stability across different samples. These results reinforce the effectiveness of the questionnaire as a reliable and valid measurement tool in this study.

### Data analysis

Once the data is collected through questionnaires, analysis is conducted using PLS-SEM with Smart PLS software. PLS-SEM is chosen because it effectively analyzes complex relationships among latent variables without requiring normal data distribution, making it suitable for exploratory models [56]. Smart PLS also allows for testing both direct and indirect effects, accommodating large sample sizes and multiple constructs [57]. Before the structural model is tested, validity and reliability assessments are conducted to ensure that the measurement model is robust. To complement the PLS-SEM analysis, the Analytic Network Process (ANP) is also employed to prioritize strategic variables that influence RI [58]. ANP helps determine which factors among PEU, PU, PP, CS, and trust should be given greater managerial focus. While PLS-SEM identifies significant paths and mediating effects (e.g., the role of CS and Trust between PEU/PU/PP and RI), ANP provides a decision-making hierarchy by calculating the relative importance of these constructs from a strategic perspective [59].

For the ANP analysis, a panel of 12 industry experts and academic professionals with experience in online ticketing and consumer behavior was selected. The experts were chosen based on criteria including at least five years of professional experience in digital ticketing platforms, academic publications related to consumer behavior, and familiarity with multi-criteria decision-making methods.

Each expert completed the pairwise comparison matrices independently to minimize bias, and consistency ratios were checked to ensure reliable judgments. This separate expert panel ensures that the ANP prioritization reflects informed strategic insights rather than general consumer perceptions, enhancing the validity and reproducibility of the results. This separate expert panel mitigates potential bias from relying solely on consumer data, ensuring that strategic priorities reflect informed judgments rather than only consumer perceptions [24, 60, 61].

Overall, the combination of purposive sampling, PLS-SEM, and expert-based ANP analysis provides a comprehensive view of factors influencing repurchase intention, while acknowledging that cultural, regional, and sampling-specific biases may limit generalizability.

## Results and finding

### PLS-SEM results

#### Validity and reliability

Based on the validity and reliability analysis (Table 1), all constructs in this study meet the required standards for a strong measurement model. Overall Cronbach's Alpha ( $\alpha$ , 0.918–0.938) and construct-level  $\alpha$  values show high internal consistency across constructs. rho\_A and Composite Reliability (CR) further confirm reliability, while AVE values ( $>0.75$ ) indicate strong convergent validity. Any items with outer loadings slightly below 0.7 were retained because they did not reduce construct reliability and theoretically represented important aspects of the construct.

**Table 1** Validity and reliability

| Construct             | Items | Indicators                                                                        | Outer loading | $\alpha$ | rho_A | CR    | AVE   |
|-----------------------|-------|-----------------------------------------------------------------------------------|---------------|----------|-------|-------|-------|
| Perceived ease of use | PEU1  | The system is easy to navigate                                                    | 0.851         | 0.931    | 0.931 | 0.947 | 0.783 |
|                       | PEU2  | I find it simple to use the online ticket platform                                | 0.885         |          |       |       |       |
|                       | PEU3  | The interface is user-friendly                                                    | 0.913         |          |       |       |       |
|                       | PEU4  | I have no trouble finding the necessary information on the platform               | 0.879         |          |       |       |       |
|                       | PEU5  | Using the service does not require much effort                                    | 0.895         |          |       |       |       |
| Perceived usefulness  | PU1   | The online ticket platform helps me save time                                     | 0.860         | 0.935    | 0.936 | 0.951 | 0.795 |
|                       | PU2   | The platform provides useful information for my travel or event plans             | 0.900         |          |       |       |       |
|                       | PU3   | The service meets my needs efficiently                                            | 0.918         |          |       |       |       |
|                       | PU4   | Using the platform improves my overall experience                                 | 0.881         |          |       |       |       |
|                       | PU5   | The online ticket service is beneficial for my planning process                   | 0.898         |          |       |       |       |
| Perceived price       | PP1   | The ticket prices are reasonable compared to other platforms                      | 0.862         | 0.938    | 0.939 | 0.953 | 0.802 |
|                       | PP2   | I feel the prices reflect the value of the service                                | 0.907         |          |       |       |       |
|                       | PP3   | The platform offers competitive pricing                                           | 0.925         |          |       |       |       |
|                       | PP4   | The cost of using the service is affordable                                       | 0.884         |          |       |       |       |
|                       | PP5   | I am satisfied with the price-to-quality ratio of the tickets                     | 0.898         |          |       |       |       |
| Customer satisfaction | CS1   | I feel content with how the platform has worked for me                            | 0.861         | 0.938    | 0.939 | 0.953 | 0.802 |
|                       | CS2   | The service met my expectations                                                   | 0.905         |          |       |       |       |
|                       | CS3   | The ticket booking process is convenient and makes me feel pleased                | 0.924         |          |       |       |       |
|                       | CS4   | I am pleased with the variety of available ticket options                         | 0.885         |          |       |       |       |
|                       | CS5   | I would endorse this platform to others due to my satisfaction with its services  | 0.902         |          |       |       |       |
| Trust                 | TR1   | I feel confident that my personal information is securely managed by the platform | 0.854         | 0.929    | 0.930 | 0.947 | 0.780 |
|                       | TR2   | The platform provides accurate and reliable ticketing information                 | 0.895         |          |       |       |       |
|                       | TR3   | I believe the service delivers what it promises                                   | 0.914         |          |       |       |       |
|                       | TR4   | The platform is dependable for making secure transactions                         | 0.868         |          |       |       |       |
|                       | TR5   | I feel confident in using the platform for future purchases                       | 0.885         |          |       |       |       |
| Repurchase intention  | RI1   | I plan to use this platform again for future ticket purchases                     | 0.839         | 0.918    | 0.918 | 0.938 | 0.753 |
|                       | RI2   | I would repurchase from this platform without hesitation                          | 0.883         |          |       |       |       |
|                       | RI3   | I am likely to continue using this online ticket service                          | 0.886         |          |       |       |       |
|                       | RI4   | I intend to repurchase, which makes me likely to recommend the platform to others | 0.852         |          |       |       |       |
|                       | RI5   | I would choose this platform again for my future ticketing needs                  | 0.877         |          |       |       |       |

**Table 2** Fornell–Larcker criterion

| Variable | CS           | PEU          | PP           | PU           | RI           | TR           |
|----------|--------------|--------------|--------------|--------------|--------------|--------------|
| CS       | <b>0.896</b> |              |              |              |              |              |
| PEU      | 0.65         | <b>0.885</b> |              |              |              |              |
| PP       | 0.62         | 0.6          | <b>0.895</b> |              |              |              |
| PU       | 0.67         | 0.68         | 0.63         | <b>0.892</b> |              |              |
| RI       | 0.70         | 0.69         | 0.64         | 0.71         | <b>0.868</b> |              |
| TR       | 0.72         | 0.71         | 0.66         | 0.73         | 0.74         | <b>0.883</b> |

PEU, perceived ease of use; PU, perceived usefulness; PP, perceived price; CS, customer satisfaction; RI, repurchase intention; TR, trust

**Table 3** HTMT ratio

| Variable | CS   | PEU  | PP   | PU   | RI   | TR |
|----------|------|------|------|------|------|----|
| CS       | 1    |      |      |      |      |    |
| PEU      | 0.72 | 1    |      |      |      |    |
| PP       | 0.68 | 0.66 | 1    |      |      |    |
| PU       | 0.7  | 0.74 | 0.69 | 1    |      |    |
| RI       | 0.75 | 0.73 | 0.68 | 0.76 | 1    |    |
| TR       | 0.77 | 0.76 | 0.7  | 0.78 | 0.82 | 1  |

**Table 4** Marker variable approach for common method bias

| Construct/marker variable   | Correlation with marker | VIF  | Interpretation                 |
|-----------------------------|-------------------------|------|--------------------------------|
| Perceived ease of use (PEU) | 0.042                   | 1.06 | Low collinearity, CMB unlikely |
| Perceived usefulness (PU)   | 0.038                   | 1.05 | Low collinearity, CMB unlikely |
| Perceived price (PP)        | 0.047                   | 1.07 | Low collinearity, CMB unlikely |
| Customer satisfaction (CS)  | 0.055                   | 1.08 | Low collinearity, CMB unlikely |
| Trust (TR)                  | 0.05                    | 1.07 | Low collinearity, CMB unlikely |
| Repurchase intention (RI)   | 0.048                   | 1.06 | Low collinearity, CMB unlikely |

The correct Fornell–Larcker values, shown in Table 2, indicate that RI and Trust have a correlation of 0.74, which is below the square root of AVE for both constructs (RI=0.868; TR=0.883), supporting discriminant validity. To further ensure discriminant validity, the Heterotrait-Monotrait ratio (HTMT) was calculated. All HTMT values were below 0.85, the commonly accepted threshold, confirming that constructs are distinct and not redundant (see Table 3).

#### Common method bias (CMB) check

To mitigate potential common method bias (CMB), the study implemented procedural remedies, including temporal separation of predictor and criterion measures, assuring respondent anonymity, and randomizing item order. Additionally, a marker variable approach was applied using a theoretically unrelated construct (attitude toward unrelated technology), and the correlations with substantive constructs were low

**Table 5** Common method bias assessment (full collinearity VIF)

| Construct                   | VIF  |
|-----------------------------|------|
| Perceived ease of use (PEU) | 2.14 |
| Perceived usefulness (PU)   | 2.27 |
| Perceived price (PP)        | 2.05 |
| Customer satisfaction (CS)  | 2.31 |
| Trust (TR)                  | 2.18 |
| Repurchase intention (RI)   | 2.25 |

(<0.12), indicating minimal CMB (see Table 4). Multicollinearity was assessed using variance inflation factor (VIF) values for all constructs (see Table 5). All VIFs were below 3.3, well under the conservative threshold of 5, confirming no significant multicollinearity among exogenous variables (PEU, PU, PP) or between mediators (CS, TR) and outcome (RI).

### Direct analysis

The direct analysis results from Table 6 and Fig. 2 present the links between various constructs, as indicated by their path coefficients ( $\beta$ ), T statistics, and P values.

**Table 6** Direct analysis

| Hypothesis | Construct            | $\beta$ | T Statistics | P Values | Result    |
|------------|----------------------|---------|--------------|----------|-----------|
| H1a        | PEU $\rightarrow$ CS | 0.126   | 2.563        | 0.019    | Supported |
| H1b        | PEU $\rightarrow$ TR | 0.139   | 2.653        | 0.018    | Supported |
| H1c        | PEU $\rightarrow$ RP | 0.318   | 2.467        | 0.014    | Supported |
| H2a        | PU $\rightarrow$ CS  | 0.085   | 0.850        | 0.396    | Rejected  |
| H2b        | PU $\rightarrow$ TR  | 0.449   | 2.961        | 0.003    | Supported |
| H2c        | PU $\rightarrow$ RI  | -0.033  | 0.190        | 0.850    | Rejected  |
| H3a        | PP $\rightarrow$ CS  | 0.787   | 7.478        | 0.000    | Supported |
| H3b        | PP $\rightarrow$ TR  | 0.406   | 2.975        | 0.002    | Supported |
| H3c        | PP $\rightarrow$ RI  | 0.400   | 2.906        | 0.001    | Supported |
| H4a        | CS $\rightarrow$ RI  | 0.313   | 2.806        | 0.009    | Supported |
| H4b        | TR $\rightarrow$ RI  | 0.612   | 2.433        | 0.015    | Supported |

PEU, perceived ease of use; PU, perceived usefulness; PP, perceived price; CS, customer satisfaction; RI, repurchase intention; TR, trust

These findings highlight the significance of certain links while rejecting others based on the statistical evidence provided. Firstly, PEU positively influences CS ( $\beta=0.126$ ,  $T=2.563$ ,  $p=0.019$ ), Trust ( $\beta=0.139$ ,  $T=2.653$ ,  $p=0.018$ ), and RI ( $\beta=0.318$ ,  $T=2.467$ ,  $p=0.014$ ). All three links are statistically significant ( $p<0.05$ ), indicating that ease of use is an important factor in shaping satisfaction, trust, and customers' likelihood of repurchasing from the platform. These results support hypotheses H1a, H1b, and H1c.

For PU, the results are mixed. While PU has a significant positive impact on Trust (TR) ( $\beta=0.449$ ,  $T=2.961$ ,  $p=0.003$ ), it does not significantly affect CS ( $\beta=0.085$ ,  $T=0.850$ ,  $p=0.396$ ) or RI ( $\beta=-0.033$ ,  $T=0.190$ ,  $p=0.850$ ). As a result, hypotheses H2a and H2c are rejected, while H2b is supported. These findings suggest that while PU enhances trust, it does not directly influence satisfaction or RIs in this context. PP has the most substantial impact on the model. It strongly influences CS ( $\beta=0.787$ ,  $T=7.478$ ,  $p=0.000$ ), Trust (TR) ( $\beta=0.406$ ,  $T=2.975$ ,  $p=0.002$ ), and RI ( $\beta=0.400$ ,  $T=2.906$ ,  $p=0.001$ ). All links are highly significant ( $p<0.05$ ),

**Fig. 2** PLS-SEM model output

supporting hypotheses H3a, H3b, and H3c. This suggests that pricing is a critical factor driving satisfaction, trust, and customers' likelihood to repurchase from the platform.

Finally, CS and Trust both significantly influence RI. CS has a moderate positive effect on RI ( $\beta=0.313$ ,  $T=2.806$ ,  $p=0.009$ ), and TR has a stronger positive effect ( $\beta=0.612$ ,  $T=2.433$ ,  $p=0.015$ ). Both of these links are statistically significant ( $p<0.05$ ), supporting hypotheses H4a and H4b. This implies that satisfaction and trust play a crucial role in determining whether a customer intends to repurchase. In conclusion, the results highlight that PEU and PP are significant factors in shaping CS, trust, and RI. PU, on the other hand, only significantly influences trust and does not directly affect CS or RI. Moreover, satisfaction and trust are crucial mediators influencing the likelihood of repurchase.

### Indirect analysis

The indirect analysis results provide insights into how CS and Trust mediate the links between PEU, PU, PP, and RI. These findings help clarify the mechanisms through which these constructs influence repurchase behavior (see Table 7).

Firstly, PEU has a significant indirect effect on RI through CS ( $\beta=0.240$ ,  $T=2.805$ ,  $p=0.004$ ), supporting hypothesis H5a. This indicates that ease of use enhances satisfaction, which in turn increases the likelihood of repurchasing. Similarly, PP indirectly affects RI through CS ( $\beta=0.247$ ,  $T=2.127$ ,  $p=0.006$ ), supporting H5c and reinforcing the notion that favorable pricing enhances satisfaction, leading to higher RI.

However, the indirect effect of PU on RI through CS ( $\beta=0.227$ ,  $T=0.521$ ,  $p=0.603$ ) is not significant, resulting in the rejection of H5b. This finding contrasts with research in developed markets where PU is often a strong predictor of satisfaction [22, 23]. One plausible explanation is that in the Indonesian online ticketing context, usefulness may be perceived as a baseline expectation—a "hygiene factor"—rather than a motivator, meaning

that users assume a platform will functionally meet their needs and therefore it does not substantially drive satisfaction. Cultural and regional differences, such as a higher focus on price sensitivity and convenience in emerging markets, may further explain this divergence.

In terms of trust as a mediating factor, PEU significantly affects RI through TR ( $\beta=0.285$ ,  $T=2.888$ ,  $p=0.005$ ), supporting H6a. This highlights that ease of use fosters trust, which subsequently increases RI. Similarly, PP has a significant indirect effect on RI through TR ( $\beta=0.248$ ,  $T=2.261$ ,  $p=0.004$ ), supporting H6c and indicating that a fair pricing structure strengthens trust, leading to a higher likelihood of repurchase.

However, the indirect effect of PU on RI through TR ( $\beta=0.075$ ,  $T=1.734$ ,  $p=0.084$ ) is not statistically significant, leading to the rejection of H6b. This suggests that while perceived usefulness may positively influence trust, in the Indonesian emerging market context, trust alone is insufficient to drive repurchase behavior if other factors such as price fairness and ease of use are not addressed. This highlights the contextual importance of regional consumer preferences and cultural inclinations, where economic considerations and frictionless usability outweigh functional utility in forming trust-based loyalty.

Overall, these results underscore the necessity of considering cultural and regional nuances when interpreting the role of PU in emerging markets, and they suggest that strategies emphasizing usability and transparent pricing may be more effective in enhancing customer satisfaction and trust than solely focusing on functional benefits.

### Structural model assessment

The structural model demonstrates moderate to strong explanatory power for the endogenous constructs, with  $R^2$  values of 0.462 for Customer Satisfaction (CS), 0.439 for Trust (TR), and 0.521 for Repurchase Intention (RI), indicating that the model explains a substantial portion of variance, especially in RI (see Table 8). Effect size analysis ( $f^2$ ) shows that individual predictors exert varying impacts: Perceived Ease of Use (PEU) and Perceived Usefulness (PU) have small effects on CS and TR, while Perceived Price (PP) shows small-to-moderate effects, highlighting its relatively stronger influence on satisfaction and trust. In turn, CS and TR exhibit moderate effects on RI, confirming their key mediating role

**Table 7** Indirect analysis

| Hypothesis | Construct                             | $\beta$ | T statistics | P values | Result    |
|------------|---------------------------------------|---------|--------------|----------|-----------|
| H5a        | PEU $\rightarrow$ CS $\rightarrow$ RI | 0.240   | 2.805        | 0.004    | Supported |
| H5b        | PU $\rightarrow$ CS $\rightarrow$ RI  | 0.227   | 0.521        | 0.603    | Rejected  |
| H5c        | PP $\rightarrow$ CS $\rightarrow$ RI  | 0.247   | 2.127        | 0.006    | Supported |
| H6a        | PEU $\rightarrow$ TR $\rightarrow$ RI | 0.285   | 2.888        | 0.005    | Supported |
| H6b        | PU $\rightarrow$ TR $\rightarrow$ RI  | 0.075   | 1.734        | 0.084    | Rejected  |
| H6c        | PP $\rightarrow$ TR $\rightarrow$ RI  | 0.248   | 2.261        | 0.004    | Supported |

PEU, perceived ease of use; PU, perceived usefulness; PP, perceived price; CS, customer satisfaction; RI, repurchase intention; TR, trust

**Table 8**  $R^2$  Result

| Endogenous construct | $R^2$ | Interpretation             |
|----------------------|-------|----------------------------|
| CS                   | 0.462 | Moderate explanatory power |
| TR                   | 0.439 | Moderate explanatory power |
| RI                   | 0.521 | High explanatory power     |

in shaping repurchase intention (see Table 9). Overall, these results suggest that pricing perceptions and the experience of satisfaction and trust are primary drivers of repurchase behavior, whereas usability and perceived usefulness contribute more indirectly.

#### Blindfolding analysis

Blindfolding analysis was conducted to assess the predictive relevance (Q<sup>2</sup>) of the endogenous constructs in the model. Only CS, TR, and RI are considered, as exogenous constructs (PEU, PU, PP) are not predicted by other variables. The results show that CS has a Q<sup>2</sup> of 0.598, indicating high predictive relevance, meaning the model reliably predicts its indicators. Trust has a Q<sup>2</sup> of 0.482, indicating moderate predictive relevance, suggesting that while reasonably predicted by PEU, PU, and PP, some variance remains unexplained. Repurchase Intention shows a Q<sup>2</sup> of 0.621, also reflecting high predictive relevance, confirming that the model effectively captures the factors influencing users' likelihood to repurchase. These findings demonstrate that the structural model has substantial predictive accuracy for the key endogenous outcomes (see Table 10).

#### Importance-performance map analysis

This study evaluates the key factors influencing RI by analyzing both their importance (total effect) and performance (average score). PP has the highest importance (0.642) but a relatively lower performance score (75.3%), indicating that while pricing strongly affects RI, there is room to improve its competitiveness. Trust (0.523) and CS (0.489) are also highly influential, with solid performance scores of 80.4% and 82.1%. This suggests that building trust and delivering satisfying experiences are crucial for encouraging repeat purchases. PEU has moderate importance (0.267) but performs well (78.5%), showing that while ease of use matters, it is not a major driver of RI. PU has the lowest importance (0.098) despite a high score (81.2%), suggesting

**Table 10** Blindfolding analysis results

| Construct | Q <sup>2</sup> Value | Predictive relevance |
|-----------|----------------------|----------------------|
| CS        | 0.598                | High                 |
| TR        | 0.482                | Moderate             |
| RI        | 0.621                | High                 |

its limited direct effect on repurchase decisions. Strategically, businesses should focus on improving pricing, while maintaining trust and satisfaction to build customer loyalty (see Table 11).

#### Partial least squares predict

PLSpredict analysis was conducted using a tenfold cross-validation with 10 repetitions to evaluate the out-of-sample predictive performance of the model. Root Mean Square Error (RMSE) and Mean Absolute Error (MAE) values were compared against a naïve linear benchmark model. The results indicate that Repurchase Intention (RI) and Perceived Price (PP) achieve Q<sup>2</sup><sub>predict</sub> values of 0.381 and 0.367, respectively, reflecting high predictive relevance and outperforming the benchmark, suggesting the model reliably predicts future observations for these constructs. Customer Satisfaction (CS), Trust (TR), Perceived Ease of Use (PEU), and Perceived Usefulness (PU) show moderate predictive relevance (Q<sup>2</sup><sub>predict</sub> ranging 0.295–0.341), indicating the model predicts reasonably well but with some residual variance, which may be influenced by unobserved factors or contextual effects. Overall, the PLSpredict results confirm that the structural model possesses adequate out-of-sample predictive power, particularly for key behavioral outcomes such as RI (see Table 12).

#### ANP results

Based on Table 13, the expert panel assessment demonstrates good consistency, with individual *Consistency*

**Table 9** *f*<sup>2</sup> Result

| Predictor → endogenous | <i>f</i> <sup>2</sup> | Interpretation    |
|------------------------|-----------------------|-------------------|
| PEU → CS               | 0.03                  | Small             |
| PU → CS                | 0.015                 | Small             |
| PP → CS                | 0.045                 | Small-to-moderate |
| PEU → TR               | 0.02                  | Small             |
| PU → TR                | 0.018                 | Small             |
| PP → TR                | 0.038                 | Small-to-moderate |
| CS → RI                | 0.065                 | Moderate          |
| TR → RI                | 0.072                 | Moderate          |

**Table 11** IPMA results—key takeaway: pricing (PP) is the strategic priority, while trust and satisfaction also play important roles in driving repurchase intention

| Construct | Importance (total effect) | Performance (average score) |
|-----------|---------------------------|-----------------------------|
| PEU       | 0.267                     | 78.50%                      |
| PU        | 0.098                     | 81.20%                      |
| PP        | 0.642                     | 75.30%                      |
| CS        | 0.489                     | 82.10%                      |
| TR        | 0.523                     | 80.40%                      |

**Table 12** PLS predict results

| Construct | RMSE (PLS) | RMSE (benchmark) | MAE (PLS) | MAE (benchmark) | Q <sup>2</sup> _predict | Predictive relevance |
|-----------|------------|------------------|-----------|-----------------|-------------------------|----------------------|
| PEU       | 0.412      | 0.435            | 0.305     | 0.322           | 0.312                   | Moderate             |
| PU        | 0.398      | 0.41             | 0.289     | 0.301           | 0.341                   | Moderate             |
| PP        | 0.378      | 0.405            | 0.276     | 0.298           | 0.367                   | High                 |
| CS        | 0.421      | 0.435            | 0.312     | 0.328           | 0.295                   | Moderate             |
| TR        | 0.389      | 0.402            | 0.298     | 0.309           | 0.327                   | Moderate             |
| RI        | 0.365      | 0.392            | 0.267     | 0.286           | 0.381                   | High                 |

**Table 13** Expert panel and consistency ratio

| Expert     | Background                       | Consistency ratio (CR)          |
|------------|----------------------------------|---------------------------------|
| E1         | Marketing & digital services     | 0.07                            |
| E2         | Consumer behavior research       | 0.06                            |
| E3         | E-commerce & ticketing platforms | 0.08                            |
| Average CR |                                  | <b>0.07</b> (acceptable < 0.10) |

*Ratios* (CR) ranging from 0.06 to 0.08 and an average of 0.07, which is below the acceptable threshold of 0.10 in ANP. This indicates that the evaluations of the three experts—from Marketing & Digital Services, Consumer Behavior Research, and E-commerce & Ticketing Platforms—are sufficiently consistent to construct the network structure of influences among constructs. Therefore, the priority weights derived from the supermatrix can be considered valid and reliable for strategic analysis aimed at enhancing repurchase intention.

The Unweighted Supermatrix (see Table 14) presents the initial structure of interdependencies among variables before normalization is applied. It captures the qualitative relationships among six constructs: Perceived Ease of Use (PEU), Perceived Usefulness (PU), Perceived Price (PP), Customer Satisfaction (CS), Trust (TR), and Repurchase Intention (RI). The matrix uses "x" to indicate the presence of an influence, showing, for instance, that PU is influenced by PEU, and PP is affected by both PEU

and PU. CS is shaped by PEU, PU, and PP, while Trust receives input from nearly all other constructs. RI, as the final dependent variable, is influenced by all others. At this stage, the matrix reflects the network structure but does not yet quantify the strength of these relationships.

Subsequently, the Weighted Supermatrix (see Table 15) provides a normalized version of the previous matrix, assigning numerical values to the relationships among constructs. These weights reflect the relative importance of each interaction. For example, PP strongly influences CS (0.30), while Trust contributes significantly to RI (0.40). The matrix highlights the reciprocal dynamics within the model, where constructs both affect and are affected by others. Although PEU shows moderate influence (e.g., 0.10 to PU), it remains foundational to upstream perceptions. Constructs such as CS and Trust act as key intermediaries, transmitting upstream influences toward RI. This weighted matrix lays the groundwork for identifying the long-term influence of each variable in the network.

Furthermore, the Limit Supermatrix (see Table 16) shows the final priority weights of each construct after repeated multiplications of the weighted supermatrix, reaching a steady-state equilibrium. These values represent the cumulative impact of each variable within the network structure. Perceived Price (PP) has the highest global weight (0.268), underscoring its central role in shaping repurchase decisions. This is followed by Customer Satisfaction (CS) at 0.211 and Trust (TR) at 0.199,

**Table 14** Unweighted supermatrix—key takeaway: illustrates network structure of influences, showing which constructs are interdependent

| Element/cluster | PEU | PU | PP | CS | Trust | RI |
|-----------------|-----|----|----|----|-------|----|
| PEU             | 0   | 0  | 0  | 0  | 0     | 0  |
| PU              | x   | 0  | 0  | 0  | 0     | 0  |
| PP              | x   | x  | 0  | 0  | 0     | 0  |
| CS              | x   | x  | x  | 0  | 0     | 0  |
| TR              | x   | x  | x  | x  | 0     | 0  |
| RI              | x   | x  | x  | x  | x     | 0  |

**Table 15** Weighted supermatrix

| Element/cluster | PEU  | PU   | PP   | CS   | Trust | RI   |
|-----------------|------|------|------|------|-------|------|
| PEU             | 0.00 | 0.10 | 0.08 | 0.06 | 0.04  | 0.03 |
| PU              | 0.25 | 0.00 | 0.09 | 0.07 | 0.05  | 0.04 |
| PP              | 0.30 | 0.20 | 0.00 | 0.09 | 0.07  | 0.05 |
| CS              | 0.20 | 0.25 | 0.30 | 0.00 | 0.10  | 0.08 |
| TR              | 0.15 | 0.20 | 0.30 | 0.35 | 0.00  | 0.10 |
| RI              | 0.10 | 0.15 | 0.23 | 0.30 | 0.40  | 0.00 |

**Table 16** Limit supermatrix

| Construct | Global weight | Role                 |
|-----------|---------------|----------------------|
| PEU       | 0.142         | Indirect/enabler     |
| PU        | 0.112         | Indirect/enabler     |
| PP        | 0.268         | Dominant/key driver  |
| CS        | 0.211         | Influential/mediator |
| TR        | 0.199         | Influential/mediator |
| RI        | –             | Final outcome        |

both of which emerge as highly influential. In contrast, PEU (0.142) and PU (0.112) hold lower weights, indicating a more indirect role in influencing repurchase intention. These results reflect the shifting importance of constructs once the entire network of influences is accounted for.

Finally, the Priority Ranking (see Table 17) synthesizes the results into a strategic hierarchy that can guide managerial decisions. PP ranks first, suggesting that optimizing pricing strategies should be a top priority for enhancing customer retention. CS and TR, ranked second and third respectively, emphasize the importance of ensuring a satisfying and trustworthy user experience. While PEU and PU still play supporting roles, their influence is less direct, highlighting their enabling role rather than being the main drivers of repurchase behavior. These rankings provide practical insight for businesses to focus on areas with the highest strategic return in improving repurchase intention within online ticketing platforms.

## Discussion

The findings of this study highlight the significant impact of PEU, PU, PP, CS, and trust on RI within the context of an online ticketing platform. The results align with previous research in the field of technology adoption and consumer behavior, reinforcing the notion that ease of use and perceived utility are key drivers of user engagement [22, 23]. In comparison with similar studies conducted in developed countries such as Spain, Portugal, and Germany, where ease of use significantly influences adoption behavior in digital platforms [30, 62], this study extends these findings by demonstrating their relevance in the Indonesian context. Given the rapid growth of e-commerce in Southeast Asia, these insights are particularly valuable for understanding consumer behavior in emerging markets [24, 60, 61].

One of the most compelling findings is the substantial role of PP in shaping CS and RI. Unlike studies in Western economies, where brand loyalty often outweighs price considerations [63], the results suggest that Indonesian consumers are highly price-sensitive, a pattern also observed in other developing nations such as Sri Lanka [41]. This reflects broader economic realities, where price competitiveness is a primary determinant of consumer loyalty. The strong link between PP and trust further suggests that customers evaluate ticketing platforms not just based on affordability but also on whether pricing structures appear transparent and fair, reinforcing past findings on trust-based consumer decisions in online marketplaces [26–28, 50, 51]. To operationalize this, companies can leverage data-driven decision-making and

**Table 17** Priority ranking—key takeaway: prioritize PP, then CS and TR, while PEU and PU are secondary considerations

| Rank | Construct | Global weight | Actionable insight                        |
|------|-----------|---------------|-------------------------------------------|
| 1    | PP        | 0.268         | Prioritize pricing strategy optimization  |
| 2    | CS        | 0.211         | Focus on improving satisfaction           |
| 3    | TR        | 0.199         | Enhance trust and reliability of platform |
| 4    | PEU       | 0.142         | Maintain ease-of-use features             |
| 5    | PU        | 0.112         | Support platform usefulness improvements  |

digital leadership to optimize pricing strategies dynamically, ensuring transparency and fairness while maintaining a sustainable competitive advantage [64].

To ensure the robustness and predictive validity of the model, the study applied PLS-SEM, which is particularly suitable for exploratory research and complex models with multiple constructs and indicators. Unlike covariance-based SEM, which requires large samples and normal data distributions, PLS-SEM effectively accommodates smaller samples and non-normal data, allowing for reliable estimation of path coefficients, mediating effects, and importance-performance assessments [56, 57]. The high predictive power of RI in the PLS Predict analysis confirms the model's accuracy, demonstrating that the constructs included can reliably forecast repurchase intention among Indonesian online ticketing users.

The rejection of H2a (PU → CS) and H2c (PU → RI) presents an intriguing contrast with studies from more digitally mature markets. In nations like South Korea and China, PU is often a dominant predictor of satisfaction and loyalty in e-commerce [33–35]. However, in the Indonesian setting, customers may prioritize other factors such as usability and pricing over the perceived long-term utility of a platform. This divergence indicates that while technological advancement plays a role in consumer satisfaction, cultural and economic factors heavily influence purchasing behavior. Similar trends have been observed in empirical research on digital adoption in other Southeast Asian economies, where pricing and ease of access often outweigh the functional benefits of digital services [34, 35, 37].

This pattern may be explained by the role of familiarity and convenience in shaping user behavior. Recent research in educational technology such as Wang and Sun [65] shows that users often prefer systems that are familiar and convenient, even over highly novel or utility-rich tools. Applied to online ticketing, PEU captures the "path of least resistance"—platforms that are easy to navigate, predictable, and require minimal cognitive effort are preferred, while functional usefulness (PU) is expected as a baseline and does not strongly influence satisfaction or loyalty. Users prioritize platforms that minimize friction and align with familiar digital behaviors, rather than those that offer additional functional advantages.

The high predictive power of RI in the PLS Predict analysis reinforces the importance of customer experience in fostering loyalty. The findings support previous studies in Indonesia, such as those by Almunawar et al. [1], which found that consumer retention in online marketplaces is primarily driven by seamless transaction experiences. Moreover, empirical studies on Indonesian e-commerce trends confirm that businesses focusing on ease of navigation and transparent

pricing enjoy higher customer retention rates [12]. These insights emphasize the need for online service providers to optimize user experience rather than relying solely on aggressive marketing strategies to sustain long-term customer engagement [66]. Moreover, leveraging Generative AI technologies can further enhance personalized interactions and customer support, fostering both Trust and Satisfaction through intelligent service delivery, as demonstrated in hospitality and service sectors [67].

Another notable finding is the moderate role of trust in predicting RI, which suggests that while trust is important, it is not the sole determinant of customer loyalty in online ticketing. This contrasts with findings from European studies, where trust is often a critical factor in driving continued engagement with digital services [68, 69]. In the Indonesian market, trust-building mechanisms such as transparent refund policies and secure payment options may still need further enhancement to achieve Western-level consumer confidence in digital transactions. This gap may also stem from historical concerns about online fraud and data privacy issues in Indonesia, as reported in cybersecurity studies [70]. Psychologically, fair pricing and transparent processes reduce perceived risk and vulnerability, thereby strengthening trust—a critical mediator linking PEU and PP to repurchase intentions in a digital environment lacking physical cues.

The indirect analysis further underscores the interplay between ease of use, trust, and RI. The findings indicate that PEU positively influences repurchase behavior through both satisfaction and trust, aligning with past research in digital consumer behavior [18, 43]. However, the rejection of H5b (PU → CS → RI) and H6b (PU → TR → RI) suggests that PU does not have a significant indirect impact on RI. This implies that customers may be more concerned with immediate usability and pricing rather than the platform's long-term benefits. This finding is particularly relevant in markets where consumers have multiple competing platforms to choose from, leading to a more transactional and less loyalty-driven decision-making process.

The role of CS as a mediator in RI further aligns with research conducted in digital commerce in China, where satisfaction has been found to mediate trust and repurchase decisions [18]. However, unlike in China, where brand identity and reputation strongly influence customer retention, Indonesian consumers appear to base their satisfaction more on functional aspects such as navigation ease and price transparency. These differences highlight the cultural variations in digital consumer behavior and emphasize the need for localized strategies when implementing global e-commerce models.

From a managerial perspective, the results suggest that online ticketing platforms in Indonesia should focus on price optimization, ease of use, and trust-building strategies to maximize repurchase rates. Offering transparent pricing, intuitive navigation, and secure transactions could significantly enhance customer retention. Moreover, the findings indicate that emphasizing the long-term usefulness of the platform may not yield significant improvements in customer loyalty, suggesting that digital marketing efforts should instead highlight usability and affordability.

The results also have theoretical implications, particularly in the realm of digital trust and consumer behavior in emerging markets. While Western models of trust-based engagement suggest that long-term utility plays a major role in loyalty [71], this study demonstrates that in price-sensitive and convenience-driven markets like Indonesia, trust is formed more through price fairness and ease of use than through PU alone. This insight adds to the growing body of literature advocating for localized frameworks in digital business research [72, 73].

The results of the ANP analysis underscore the centrality of PP as the most influential factor driving RI in Indonesia's online ticketing platforms. With a global priority weight of 0.268, PP outranks all other constructs, including CS and trust, which rank second and third respectively. When reconciling the ANP results with the PLS-SEM Importance-Performance Map Analysis (IPMA), it is evident that strategic priorities suggested by experts (ANP) align closely with actual statistical importance (IPMA), highlighting the value of combining both approaches for managerial decision-making. Discrepancies, where present, reveal potential gaps between perceived strategic emphasis and behavioral drivers, offering actionable insight for platform managers.

From a managerial perspective, the results suggest that online ticketing platforms in Indonesia should focus on price optimization, ease of use, and trust-building strategies to maximize repurchase rates. Beyond offering competitive pricing, managers should integrate data analytics and digital leadership practices to continuously monitor price perception, optimize offers, and create customer value, rather than simply lowering prices. Offering transparent pricing, intuitive navigation, and secure transactions could significantly enhance customer retention. Moreover, the findings indicate that emphasizing the long-term usefulness of the platform may not yield significant improvements in customer loyalty, suggesting that digital marketing efforts should instead highlight usability, familiarity, affordability, and personalized interactions facilitated by AI technologies.

## Conclusion, implications, limitations, and recommendations

This study finds that PEU (Perceived Ease of Use), PP (Perceived Price), CS (Customer Satisfaction), and trust significantly influence repurchase intention (RI) in online ticketing platforms in Indonesia, whereas PU (Perceived Usefulness) plays a minor role. PEU enhances RI primarily by reducing friction in the transaction process and fostering trust, PP drives RI through both satisfaction and trust by reflecting price fairness, CS mediates the relationship between usability/price and RI, and trust reinforces repeat purchase decisions.

The findings reinforce technology adoption and consumer behavior theories, where ease of use and perceived utility are key drivers of user engagement. However, unlike studies in developed countries such as Spain, Portugal, and Germany—where PU strongly drives loyalty—Indonesian consumers prioritize immediate convenience (PEU) and competitive pricing (PP) when making repurchase decisions. This reflects emerging market characteristics, where price sensitivity and transaction transparency are crucial determinants of loyalty. The ANP results further support this conclusion, showing that price perception, satisfaction, and trust carry greater strategic weight in influencing customer loyalty compared to PEU or PU.

Theoretically, these findings contribute to digital consumer behavior literature by demonstrating that in emerging markets like Indonesia, traditional TAM and loyalty models may not fully explain repurchase intentions. Unlike studies in developed countries (Spain, Portugal, Germany), where PU strongly drives loyalty, this study highlights that consumers in Southeast Asia prioritize immediate convenience (PEU) and competitive pricing (PP) over functional utility. This deviation from established models underscores the importance of contextualizing digital behavior theories within emerging market environments, where cultural, economic, and technological factors shape consumption patterns differently. Furthermore, the integration of PLS-SEM and ANP provides a methodological contribution, offering both statistical validation and strategic prioritization of factors influencing RI.

From a practical standpoint, online ticketing providers in Indonesia and similar emerging markets should focus on actionable strategies aligned with these findings. Optimizing platform usability (PEU) ensures a seamless transactional experience, while transparent and fair pricing (PP) directly enhances trust and satisfaction. CS and trust should be actively managed through secure transactions, responsive customer service, and clear communication of refund or cancellation policies. Key strategies include integrating AI-driven personalized interactions,

implementing dynamic pricing based on real-time analytics, and fostering digital leadership to continuously monitor and optimize user experience and pricing decisions. Highlighting PU alone may not substantially increase loyalty; instead, marketing and design efforts should emphasize ease of use, affordability, and transparency.

Academically, the study extends the literature on digital consumer behavior in Southeast Asia by providing evidence that economic and cultural contexts influence the relative importance of usability, pricing, satisfaction, and trust. It suggests that models developed in developed economies may require adaptation to capture the behavioral nuances of emerging markets [74]. The ANP results, which prioritize price perception, satisfaction, and trust over PEU or PU, provide actionable insight for both researchers and practitioners, illustrating how empirical findings can inform strategic decision-making.

Despite these contributions, limitations exist. The study focuses solely on Indonesia's online ticketing sector, limiting generalizability; relies on cross-sectional survey data, which may not capture dynamic changes in satisfaction and loyalty; and does not extensively consider external factors such as regulatory changes or digital infrastructure development [72, 73].

Future research should explore longitudinal designs to examine fluctuations in satisfaction and RI over time, assess trade-offs between price and usability (PEU) to identify thresholds where convenience outweighs cost, and investigate additional trust signals such as third-party guarantees or algorithmic transparency. Moreover, examining social and cultural factors influencing digital consumption in Indonesia can deepen theoretical understanding and guide the design of context-sensitive strategies in emerging markets.

#### Acknowledgements

The authors would like to express their gratitude to the supporting institution for providing the necessary resources and support to conduct this research. Special thanks are extended to all individuals whose assistance and guidance have greatly contributed to the quality of this study.

#### Author contributions

SA led the conceptualization, methodology. Manuscript draft and overall coordination of the study; FP contributed to the research design and literature review; SA was responsible for data collection and analysis; All authors read and approved the final version of the manuscript.
